

FESEM-EDX study of the painted surface of the Mikado 141F engine

R+D Project AICO/2021/095

“Developing strategies against climate change for the preventive conservation of
Valencian railway-tramway heritage”

Financial support by *Consellería de Innovación, Universidades, Ciencia y Sociedad Digital. Dirección General de Ciencia e Investigación. Subvenciones para la realización de proyectos I+D+i desarrollados por grupos de investigación consolidados 2021*

Authors:

María Teresa Doménech Carbó
Miguel F. Silva

Date:

Valencia, 11th July 2022

Instrumentation:**Instrumentation:**

Field emission scanning electron microscope coupled to a focused ion beam Zeiss (Orsay Physics Kleindiek Oxford Instruments) model Auriga compact equipment with an Oxford-X Max system controlled by Aztec software.

Working conditions:

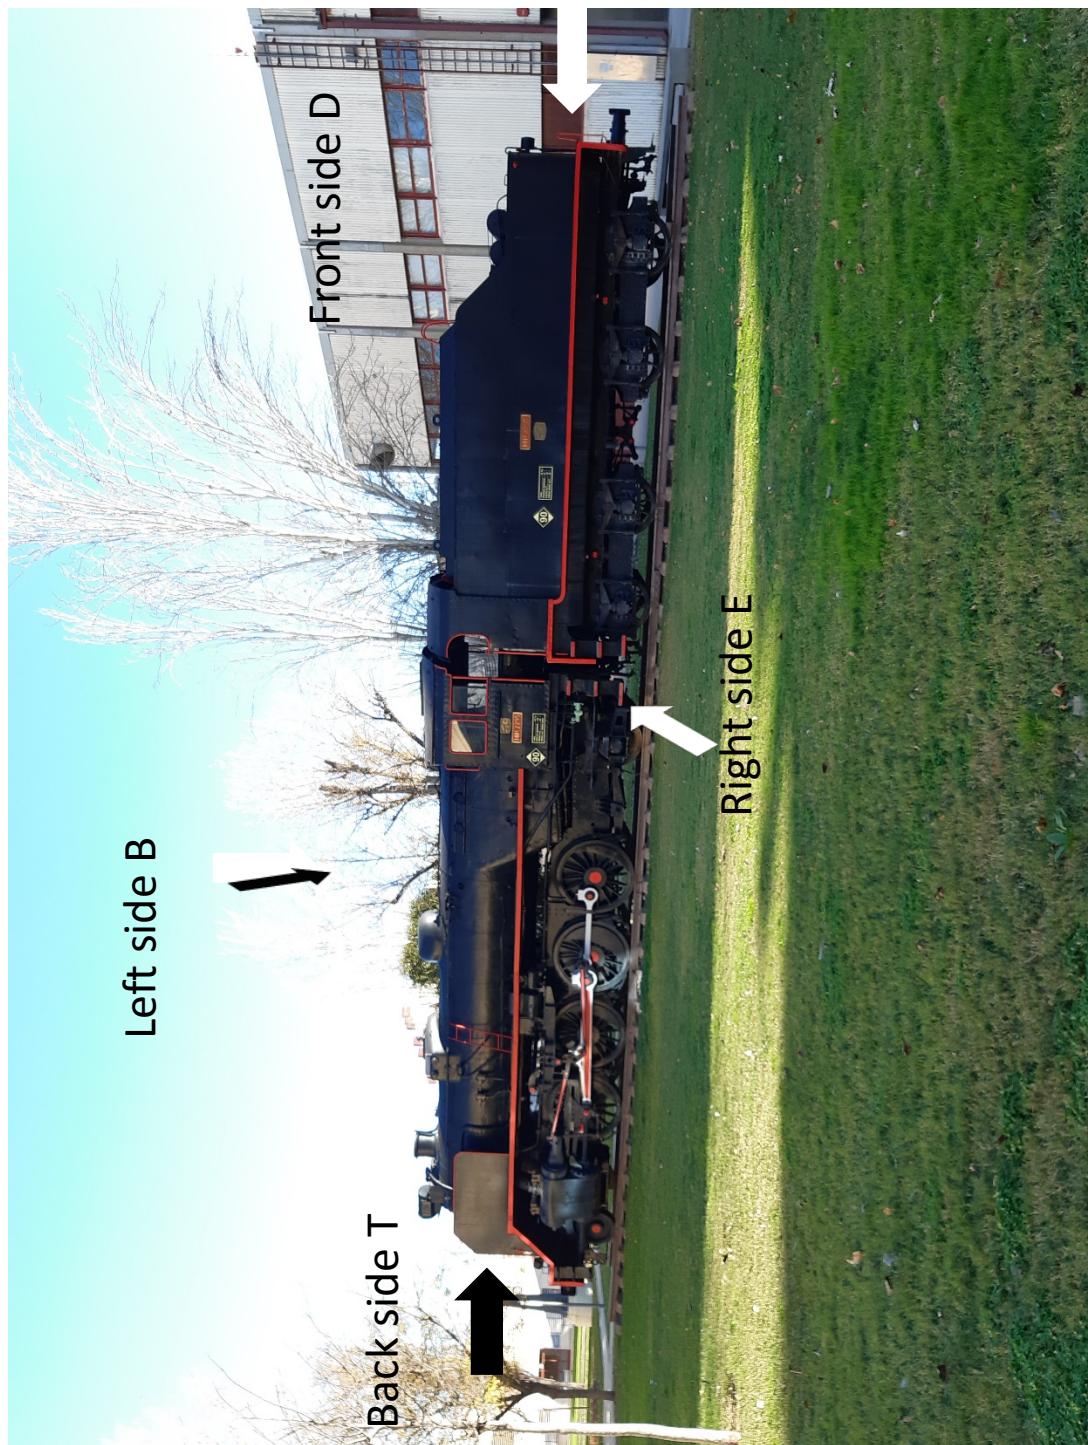

FESEM: voltage of 3 kV for acquiring secondary electron images.

FESEM-EDX: voltage of 20 kV, working distance of 6–7 A mm were applied.

ZAF method to correct interelemental effects in semiquantitative microanalysis was carried out.

Counting time of 100 s.

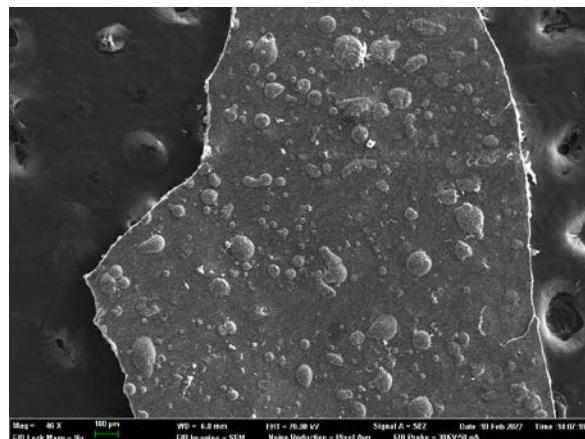

Map of the engine:

Total:		100		100	100	$S/Ba = 1,26$

The higher value of the S/Ba molar ratio than that ideal of 1,00 corresponding to the barite is associated to rests of the reagent iron(II) sulfate heptahydrate used in the solid state reaction that takes place in the roasting process of synthesis of iron oxide red. The oxidative calcination of this reagent produces $\alpha\text{-Fe}_2\text{O}_3$
